

Software Developer Intern

Mini-Project Assignment

Evaluation task for candidates applying to the Zepnest Engineering team.

Thank you for your interest in the **Zepnest Software Developer Internship**. As part of our evaluation, please complete the mini-project described below. This assignment helps us understand your technical skills, problem-solving approach, coding standards, and how you think about application architecture.

About Zepnest

Zepnest is a home-services platform — *Home Care, At a Tap*. Customers raise service requests, providers fulfil them, and the platform keeps everything visible end-to-end. The mini-project below intentionally mirrors that workflow at a small scale.

PROJECT

Service Request Application

Build a simple full-stack application where users can create and manage service requests — mirroring the kind of workflow that powers Zepnest's home-care platform.

Objective

Build a simple application where users can **create and manage service requests**. Focus on a clean, working end-to-end flow rather than feature breadth.

Core Features

- **User Registration & Login** — secure signup and authentication.
- **Create Service Request** — e.g. title, description, category, address, preferred time.
- **View Service Requests** — list a user's requests with key details.
- **Update Request Status** — e.g. *Pending* → *In Progress* → *Completed* / *Cancelled*.
- **Delete Request** — remove a request the user owns.
- **Image Upload (optional)** — attach a reference photo to a request.

Bonus (Optional, not required to qualify)

- AWS S3 integration for image storage.
- Swagger / OpenAPI documentation.
- Pagination and search on the request list.
- Deployment to any cloud or hosting platform with a live URL.

Suggested Technology Stack

Pick what you are most comfortable with — we evaluate on how well you use the stack, not which one.

Layer	Suggested Technologies
Frontend	React / React Native

Layer	Suggested Technologies
Backend	Java / Python / Node.js
Database	MySQL

Evaluation Criteria

Criterion	What we look for
Code Quality	Readable, consistent, well-named, idiomatic.
API Design	Clear endpoints, correct HTTP verbs and status codes.
Database Structure	Sensible schema, relationships, and indexing.
Problem-Solving	How you approach scope, trade-offs, and edge cases.
Error Handling	Validation, meaningful errors, graceful failures.
Architecture	Separation of concerns, modularity, scalability mindset.
Communication	Ability to explain your implementation decisions.

Submission Requirements

- **GitHub repository link** (public, or invite access if private).
- **README** with setup and run instructions.
- **API documentation** or a Postman collection.
- **Database schema** or .sql file.
- **Screenshots or a short demo video** (*optional but recommended*).

Important Notes

Ground rules

- **AI tools are allowed** (ChatGPT, Cursor, Copilot, etc.).
- You must **understand and be able to explain** every part of the code you submit.
- **Clean, maintainable, working** code beats a long feature list. Don't over-build.

Internship & Career Opportunity

Selected candidates will undergo internship training with the Zepnest engineering team. Based on training performance, technical capability, learning attitude, and overall contribution, interns may be considered for a **full-time role at Zepnest**.

Deadline

Please submit your work within **one week** from the date this assignment is shared with you. If you need clarification at any point, reply on the same email thread and the hiring team will get back to you.

We look forward to your submission. — Zepnest Hiring Team
